

Scientific writing in dental traumatology

EDITORIAL

Much good research is carried out in the field of dental traumatology, and we are receiving many manuscripts. Although many submissions are from good-quality research projects, the scientific writing is often a cause for revision and sometimes even rejection of potentially good research projects. In two previous articles, in the last issue of dental traumatology, aspects of design and reporting of epidemiological, clinical and experimental studies in the field of dental traumatology have been given. In this issue, you will find an article in scientific writing, namely about how to write an original article in dental traumatology. The original article is the mode of

communication when reporting research and the base for all evidence-based research. However, a certain strict-rule work and structure have to be followed when writing such an article. The authors have long experience as researchers, editors and publishers in the field of dental traumatology and share their experience in this article. It is our hope that this article will add some value for your scientific writing. Welcome with your submission.
