

Addendum

In this issue of Dental Traumatology, five articles have been brought analysing the pulp and periodontal healing after luxation injuries with particular emphasis on teeth with combination injuries (1–5). The data include 1134 teeth. In this context, it should be clarified that some of the data – teeth with isolated luxation injuries ($n = 549$) – have previously been analysed in respect of pulp complications in a series of articles by Dr Odont Frances Andreasen and summarized in her thesis *ISBN 87-985538-0-1 Weiss Printing house Copenhagen* from 1995 entitled ‘Pulpal healing after tooth luxation and root fractures in the permanent dentition’.
